/54 cont./

According to his expense accounts he produced 85% of food stuffs and almost all of his seed. This shows how self sufficient the farmer of Megali Vrisi is and if he raised his vegetables too, there would be very few food articles bought from the market. 241 511

This representative farmer experiencing the prosperous year of 1934 was able besides spending for construction of a stable and a well, to deposit in the bank 2,000 drs. so as to have them during the lean years. [454]

Government Subsidy of Wheat Production

During the twentieth century the governments of various countries have introduced certain methods to regulate production, consumption and export. Some of these principles have had temporary successes and some others have failed. These governmental controls have in many instances created social changes and economic difficulties. The adoption of one crop enterprise and the creation of leisure seasons due to prohibition of certain other crops have made it difficult for the farmers to fit themselves in the new scheme of life. By subsidizing the wheat crop and fixing its market price the government has persuaded the farmers to plant only /55/ wheat and neglect rotation and other crops. 241 461 [654] [435]

Wheat being a seasonal crop provides ample leisure time for the farmer and thus ample spending periods. He is unable to find anything to occupy his time for something productive and useful in his occupation. Thus many people during the winter months leave the village for outside work. The girls in most cases find work in tobacco districts and the men in road construction. The conditions under which the girls and the men work are very poor and unhealthy, many returning home with poor health. It is a big problem with one crop farming to find something to absorb the leisure time of the farmers. [464] [499] [466]

The few experiments which were conducted in cooperation with the farmers of raising irrigated alfalfa and vetch and the introduction of dairy farming threw a hopeful light on what could be done to intensify agriculture so as to absorb all the available labor. [246] [234]
